

Table 1. The five census-relevant genes among the 61-gene ATFS-1 regulon.

Gene	Sequence name	Pfam domain	Census rule	Rank (Score/var)	Rank (Score)	Bound (published, Soo 2021)	Bound (Nargund 2015)	Bound (this study)
dnj-10	F22B7.5	DnaJ	Strict census (chaperone)	23	45	No	No	No
ymel-1	M03C11.5	Peptidase_M41	Strict census (protease)	58	61	No	Yes	Yes
prx-19	F54F2.8	PF04614 (Pex19)	Permissive only - excluded, no census domain	20	54	Yes	Yes	Yes
tspo-1	C41G7.9	PF03073 (TspO_MBR)	Permissive only - excluded, no census domain	21	42	Yes	Yes	Yes
cbp-3	F40F12.7	PF02135 (zf-TAZ)	Permissive only - excluded, no census domain	57	44	No	No	No

Rank/of 61 on both metrics, conservative (Score/variability) first. Binding is reported from three independent sources rather than collapsed into one column; the ymel-1 disagreement (published: no; Nargund 2015 and this study: yes) is the reconciled case documented in gate_decisions.md, not a new discrepancy. For reference, ymel-1's raw Score value is 118.8, the lowest of the five genes shown here.
